

User Guide: wuthesis LaTeX Template

1. Getting Started

To begin drafting your document, locate the primary source files in the root directory. You will edit these files to add your specific content:

- **For a Proposal (开题报告):** Open and modify `proposal.tex`. This file is pre-configured for thesis proposals.
 - **For a Thesis (毕业论文) :** Open and modify `thesis.tex`. This is the master file for your dissertation or master's thesis.
-

2. Managing References

Bibliography management is handled via BibTeX. Ensure all your citations are properly formatted in the corresponding database files:

- **Proposal Citations:** Add your BibTeX entries to `proposal.bib`.
 - **Thesis Citations:** Add your BibTeX entries to `thesis.bib`.
-

3. Compilation Instructions

The template is compatible with standard LaTeX distributions. Below are specific instructions for common editing environments.

Option A: Overleaf

Note

By preliminary test, it is very easy to exceed the compile limit for the `.tex` file here in Overleaf for a free trial account. It is best if you have a Pro account or compile the document directly in a local environment (switch to Option B or Option C).

1. **Import the .zip**

2. Choose the correct Compiler

Since we are using `.tex` especially designed to include Chinese, to properly compile the file, we need to first change the compiler.

- Go to setting:

- Go to Compiler, Select Compiler to be **XeLaTeX** (default is `pdfLaTeX`):

Option B: Visual Studio Code (VS Code) Recommended

- Download the correct version of TeX according to your system at <https://www.latex-project.org/get/> (if you have never done this before):

Linux

Check your Linux distributions software source for a TeX distribution including LaTeX. You can also install the current [TeX Live distribution](#) directly---in fact this may be advisable as many Linux distributions only contain older versions of TeX Live, see [Linux TeX Live package status](#) for details.

These are free distributions, i.e., there are no charges for download or use.

Mac OS

The [MacTeX](#) distribution contains everything you need, including a complete TeX system with LaTeX itself and editors to write documents.

This is a free distribution, i.e., there are no charges for download or use.

Windows

Check out the [MiKTeX](#) or [TeX Live](#) distributions; they contain a complete TeX system with LaTeX itself and editors to write documents.

These are free distributions, i.e., there are no charges for download or use.

Online

LaTeX online services like [Overleaf](#), [Papeeria](#), or [CoCalc](#) offer the ability to edit, view and download LaTeX files and resulting PDFs.

Most are commercial services, but several of them, though not all, offer free plans with some restrictions.

- Use a compiler (like TeXShop on Mac) as you wish, or if you are using VS Code, an easy way is to compile `.tex` in VS Code by first downloading the Extension **LaTeX Workshop**:

Extension: LaTeX Workshop ✕

LaTeX Workshop

- Decompress the `.zip` and import into VS Code:

Q1: How to get `proposal.tex` compiled into `proposal.pdf`

- Manage your references in the `.bib` file in the folder:

- Compile by calling the following lines (one by one) in terminal:

```
xelatex proposal
```

```
biber proposal
```

`xelatex proposal`

- You'll see the compiled `.pdf` file. Each time you need an update, call those three commands above again.

Q2: How to get thesis.tex compiled into thesis.pdf

Summary: Similar to compiling `proposal.tex`, manage your reference in `thesis.bib`, and call three commands in TERMINAL one by one. Only difference is that you need to change `biber proposal` to `bibtex thesis`. (Short reason if you wish to know: in proposal we have two local references, one after the literature review section, the other after the real proposal section, to reach that goal we use another engine for reference management, resulting in this change).

- Manage your references in the `.bib` file in the folder:

- Go to the proper Thesis folder in terminal:
 - Call `cd ..` to go back to parent folder
 - Call `cd Thesis` to go to the target Thesis folder

```
● shuoyihu@Shuoyis-Mac-mini Proposal % cd ..  
● shuoyihu@Shuoyis-Mac-mini WestlakeTemplatev0.1-Dec17 % cd Thesis  
○ shuoyihu@Shuoyis-Mac-mini Thesis %
```

- Compile by calling the following lines (one by one) in terminal:

```
xelatex thesis
```

```
bibtex thesis
```

`xelatex thesis`

- Enjoy your masterpiece, or improve your work to make it a masterpiece by calling those three commands above again when you need an update.

Option C: TeXShop or Command Line

Here we assume you know the default way to compile your `.tex` to `.pdf`.

However, there are several special settings required:

1. **Change your compiler to XeLaTeX** (since we have a lot of Chinese Characters in the document):

- Example: for TeXShop, go to **Settings** -> **Typeset**:

- In **Default Command**, select **Command Listed Below** and set **XeLaTeX**.

2. Configure BibTeX Engine:

- When you're compiling your proposal, change your BibTeX Engine under **Settings** -> **Engine** to **biber**. (For compiling `thesis.tex` you should use `bibtex` by default) (Short reason if you wish to know: in proposal we have two local references, one after the literature review section, the other after the real proposal section, to reach that goal we use another engine for reference management, resulting in this change):
